

Google Authenticator Scoping

See <https://authenticatorapi.com/> for example

Steps:

1. Setup button on front-end that triggers pairing during register process. Secret code should be provided by back-end
2. Setup Validate button on login, secret code provided after username and password are provided

Note: if there are requirements for registering app name, info etc just use the demo information in the provided link. Proof of concept will be shown through this process.
